

LIVE DEMO • AGENTIC AI CAPSTONE

Treasury, Liquidity & Intraday Cash Management Agent

The problem: Treasury teams need faster visibility into cash, settlement, and funding risk before small gaps become urgent issues.

5

AI agents orchestrated

\$500K

shortfall forecast, live

2 hrs

advance warning

WHAT IT DOES

Six capabilities, one liquidity workflow

1

Cash Position Monitoring

Tracks acct-001–004 balances; nostro totals \$3.9M USD / €1.8M EUR / £960K GBP in one view.

2

Liquidity Forecasting

Flagged a \$500K USD shortfall on acct-001 about 120 minutes before the breach window.

3

Funding Recommendations

Selected an Intraday Credit Line to cover the projected \$500K gap.

4

Threshold Alerting

Raised 2 live alerts: a funding-gap breach on acct-002 and a repo-rate spread breach.

5

Governance Commentary

Generates a governance-ready summary — and safely fell back to a verified template when the AI draft didn't pass its own check.

6

Stress Simulation

A delayed-settlement scenario stretched the breach window from 120 to 180 minutes.

HOW IT WORKS

A five-agent pipeline behind every liquidity check

Safety design: the system double-checks its own written summary before showing it. When the AI-written commentary couldn't be verified against the underlying numbers, it automatically fell back to a safe, data-accurate summary — exercised live in this run, not just described.

What the live run actually produced

Actual demo.html output — 127.0.0.1:8000

FORECAST

\$500,000 USD shortfall, acct-001 — est. 120 min to breach

FUNDING ACTION

Intraday Credit Line, \$500,000 USD

ACTIVE ALERTS

2 — funding-gap (acct-002), repo-rate spread

COMMENTARY

Safe fallback shown (AI draft failed its own check)

Stress test: a 2-hour delayed-settlement scenario kept the shortfall at \$500K but pushed the breach window to 180 minutes.

Where this helps — and where it goes next

IMPACT

Speeds response to intraday funding and settlement risk by turning scattered signals into one decision-ready view.

Makes risk testing visible so treasury teams can explore what-if scenarios before a shortfall becomes urgent.

NEXT STEPS

1

Connect the demo to real bank and market data sources.

2

Expand the stress-scenario library beyond delayed settlement and repo-rate stress.

3

Tighten the commentary check so fewer runs fall back to the safe summary.

Built as a time-boxed agentic AI capstone — 5 orchestrated agents, structured JSON outputs, guardrailed commentary, and a live stress-test simulation.
